# Usability Testing

- Functional Testing Compatibility Testing
- Database Testing
- Security Testing Performance Testing

Now let's look each checklist in detail:

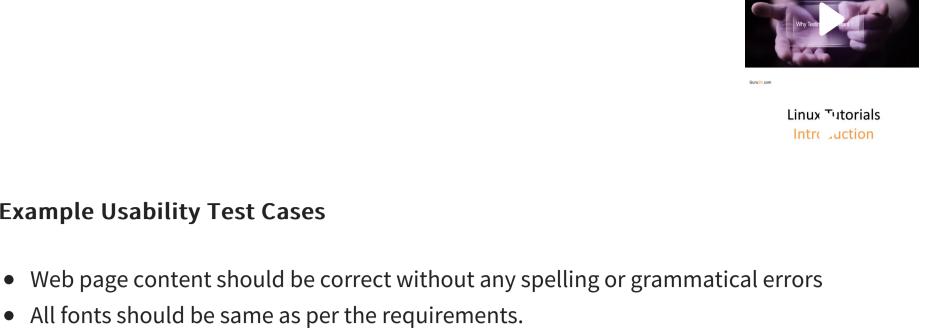

## **Usability Testing**

## • Usability testing is nothing but the User-friendliness check.

What is Usability Testing?

- application easily. • Basically, system navigation is checked in Usability testing.
- What is the purpose or Goal of Usability testing? A Usability test establishes the ease of use and effectiveness of a product using a standard
- Usability test practices.

**FEATURED VIDEOS** 

## • All the fields should be properly aligned.

**Example Usability Test Cases** 

• Enough space should be provided between field labels, columns, rows, and error messages.

• All the error messages should be correct without any spelling or grammatical errors and

• All the buttons should be in a standard format and size.

• All fonts should be same as per the requirements.

the error message should match with the field label.

• All the text should be properly aligned.

• Tool tip text should be there for every field.

- Home link should be there on every single page. Disabled fields should be grayed out. • Check for broken links and images.
- Check the site on different resolutions (640 x 480, 600x800 etc.?) • Check the end user can run the system without frustration. • Check the tab should work properly.
- Scroll bar should appear only if required. • If there is an error message on submit, the information filled by the user should be there.
- Title should display on each web page • All fields (Textbox, dropdown, radio button, etc) and buttons should be accessible by
- keyboard shortcuts and the user should be able to perform all operations by using keyboard.

**Functional Testing:** 

its specifications.

conditions.

should display.

• Check if the dropdown data is not truncated due to the field size. Also, check whether the data is hardcoded or managed via administrator.

• Testing that ignores the internal mechanism of a system or component and focuses

solely on the outputs generated in response to selected inputs and execution

- What is Functional Testing? Testing the features and operational behavior of a product to ensure they correspond to
- functional specifications mentioned in your development documentation.
- Test for negative numbers if allowed for numeric fields. • Test division by zero should be handled properly for calculations. • Test the max length of every field to ensure the data is not truncated.

data reaches the maximum size of the field.

- Test the Sorting functionality. • Test the functionality of the buttons available
- Test the Privacy Policy & FAQ is clearly defined and should be available for users. • Test if any functionality fails the user gets redirected to the custom error page.
- Test the Java script is properly working in different browsers (IE, Firefox, Chrome, safari and Opera). • Test to see what happens if a user deletes cookies while in the site.
- **Compatibility Testing:**

• Test to see what happens if a user deletes cookies after visiting a site.

What is the purpose or Goal of Compatibility testing?

### • Test the fonts are usable in different browsers. • Test the java script code is usable in different browsers. • Test the Animated GIF's across different browsers.

• Test the images display correctly in different browsers.

the website is displaying properly.

**Database Testing:** 

scenarios for Database testing.

- To perform the Database testing, the tester should be aware of the below
- mentioned points: • The tester should understand the functional requirements, business logic, application

# **Example Test Cases for Database Testing:**

- Verify the Stored procedure name • Verify the parameter names, types and number of parameters. • Test the parameters if they are required or not.
- Verify the behavior of each flag in the table. • Verify the data if the DML (Update, delete and insert) operations are performed.
- Verify the Triggers.

What is Security Testing?

### • Verify the cookies should not store passwords. server, or database information. Instead, it should display the custom error page. • Verify the SQL injection attacks.

should not be able to navigate the site.

Performance Testing is conducted to evaluate the compliance of a system or component with specified performance requirements.

• Verify the session values are in an encrypted format in the address bar.

- Practically it is not possible to do the Performance Testing manually because of some drawbacks like:
- Load Runner Borland Silk Performer. Rational Performance Tester
- **SDLC SOFTWARE TESTING** 15 Best **Keyword Driven Free Code**

YOU MIGHT LIKE:

• Verify if the password is changed the user should not be able to login with the old password. • Verify the error messages should not display any important information. • Verify if the user is logged out from the system or user session was expired, the user

view.

How to do Performance testing? By Manual Testing or by Automation • More number of resources will be required. • Simultaneous actions are not possible. • Proper system monitoring is not available.

**Testing** Keyword "login"

• Test all the uploaded documents are opened properly. • Test the user should be able to download the uploaded files. • Test the email functionality of the system.

hardware.

• The purpose of Compatibility testing is to evaluate how well software performs in a particular browser, Operating Systems, hardware or software.

• Test the website in different browsers (IE, Firefox, Chrome, Safari and Opera) and ensure

• Test the HTML version being used is compatible with appropriate browser versions.

- match with the data stored in the Database.
- flow and database design thoroughly. • The tester should figure out the tables, triggers, store procedures, views and cursors used for the application.
- Best VPNs For **iOS** 00:45:32 Compare now
- Check the length of every field: The field length in the back end and front end must be same.
- Verify the data displayed on the front end and make sure it is same in the back end. • Verify the data validity by inserting the invalid data in the database.

Security Testing involves the test to identify any flaws and gaps from a security point of

- in encrypted format. • Verify password rules are implemented on all authentication pages like Registration, forgot password, change password.
- Verify the cookie information is stored in encrypted format. Verify the application for Brute Force Attacks What is Performance Testing?
- To determine which configuration sizing provides the best performance level. • To identify application and infrastructure bottlenecks. • To determine if the new version of the software adversely had an impact on response time.

• To determine the performance, stability and scalability of an application under different

• To determine if the current architecture can support the application at peak user levels.

Apache JMeter

Hence to overcome the above problems we should use Performance Testing tool. Below is

- The tester should understand the logic of the triggers, store procedures, views and cursors created.

(DML) operations are performed through the web or desktop applications.

• The tester should figure out the tables which get affected when insert update and delete

With the help of the above mentioned points, the tester can easily write the test

- Verify whether the column allows a null or not. • Verify the Primary and foreign key of each table. • Verify the Stored Procedure: • Test whether the Stored procedure is installed or not.
- Test whether the stored procedure returns the values • Test the stored procedure with sample input data.
- Verify the database names of QA, UAT and production. The names should be unique. • Verify the encrypted data in the database.
- Verify the web page which contains important data like password, credit card numbers, secret answers for security question etc should be submitted via HTTPS (SSL). • Verify the important information like password, credit card numbers etc should display

• Verify to access the secured and non-secured web pages directly without login.

• Verify the user account gets locked out if the user is entering the wrong password

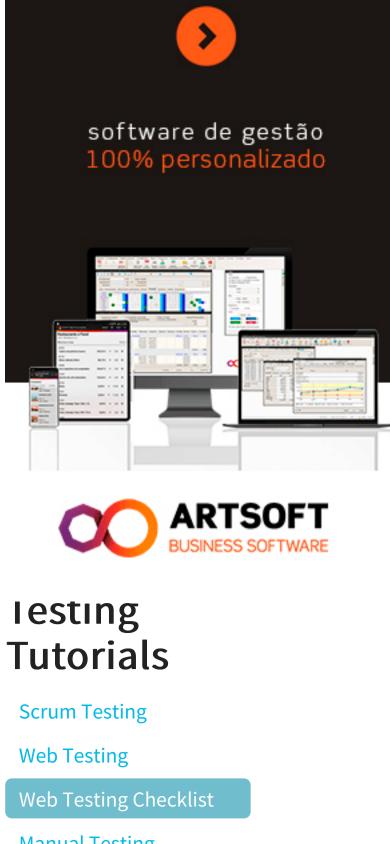

• Verify the "View Source code" option is disabled and should not be visible to the user.

- Verify the user roles and their rights. For Example, the requestor should not be able to access the admin page. • Verify the important operations are written in log files, and that information should be traceable.
- To evaluate product and/or hardware to determine if it can handle projected load volumes.
